Bryan Victoria

Full-Stack Developer / Tech Lead

Core & Dev. Manager, IT Easy Software Solutions Inc.

Mobile: 0961 921 0766 | Email: victoria.bryan.dejesus@gmail.com
Address: #57 Mahiyain, Pinhayan, Quezon City, Philippines
GitHub: github.com/bryvictoria

Professional Summary

Full-stack developer and technical lead with 14+ years of experience across the full software development lifecycle — system architecture, implementation, deployment, and long-term maintenance. Specializes in enterprise and healthcare information systems (radiology, laboratory, blood bank, biometric identity). Experienced designing OAuth2/OIDC authentication infrastructure, teleradiology and DICOM/PACS integrations, and CI/CD-driven deployment pipelines across multi-branch client sites.

Technical Skills

Languages & Frameworks: PHP (Laravel, CakePHP, Symfony), Java (Spring Boot, Spring Security, Hibernate), C#, VB.NET, Vue.js (2/3), Angular 6, JavaFX, Flutter, Quasar, Vuetify, Element Plus, Inertia.js

Databases: MySQL, PostgreSQL, MongoDB, MS SQL Server

Integration & APIs: REST API, SOAP API, OAuth2, OIDC, DICOM, RabbitMQ, WebSockets (Laravel Reverb)

DevOps & Tooling: Docker, Docker Compose, GitLab CI/CD, Unity

Professional Experience

IT Easy Software Solutions Inc.

Core & Dev. Manager (Full-Stack Developer / Tech Lead) *April 2012 – Present*

Design and develop full-stack software solutions from scratch, most of which are actively used across hospitals and health organizations. Lead client-side deployments, technical support, and on-site training.

WebRIS — Radiology Information System

Laravel (PHP) / MySQL backend · Vue 3 + Inertia.js + Element Plus frontend · Docker Compose, GitLab CI/CD, Laravel Passport (OAuth2), Laravel Reverb (WebSockets)

- Built and maintain a multi-branch Radiology Information System covering the full order lifecycle — patient registration, scheduling, radtech worklist/QA, and radiologist reporting.
- Designed a teleradiology architecture letting any branch send studies (DICOM images + case metadata) to a central reading site via an OAuth2-secured REST API and DICOM C-MOVE, with automated retry handling and result retrieval.
- Implemented role-based, multi-branch access control and a Docker + GitLab CI/CD pipeline for repeatable deployments across client sites.

WebRIS DICOM Viewer

Vue 3 + Cornerstone.js (WebGL rendering) frontend · Laravel backend proxy/streaming layer to a DCM4CHEE PACS server

- Built an in-browser DICOM viewer embedded in the RIS, supporting multiplanar reconstruction (MPR), cine playback for multi-frame/ultrasound studies, and custom annotation tools.
- Engineered a backend proxy that streams DICOM frames from a DCM4CHEE PACS server, including a custom metadata provider that patches incomplete or nonstandard tags (missing pixel spacing, VOI LUT, etc.) from certain imaging sources.

IAMServer — Identity & Access Management Server

Backend: Laravel, MySQL

- Built a central OIDC-compliant authentication and authorization server for enterprise SSO integration.

IAMCMS — IAM Client Management System

Backend: Laravel · Frontend: Vue SPA

- Built a web interface for user, role, and access control integrated with IAMServer.

MSGS — SMS Gateway System

Backend: Java (Spring Boot, Spring Security), PostgreSQL · Frontend: Angular 6

- Built a RESTful SMS notification platform with user management.

OnlineCIF — Electronic COVID-19 Information Form

Backend: CakePHP, Laravel (REST API), MySQL · Frontend: Vue.js, Vuetify, Bootstrap

- Built a web platform for COVID-19 data collection and reporting.
- Developed a second app for laboratories to manage and report patient test results.

IKnowU — Fingerprint Biometrics System

Backend: Java (Spring Boot, Spring Security, Hibernate), MySQL · Frontend: JavaFX

- Designed and implemented a biometric identity system with cross-institution deployment, featuring Java Applet-based client integration.

WebBBIS — Blood Bank Information System

Backend: CakePHP, MySQL · Frontend: HTML, jQuery

- Built a full-featured blood bank system including donor profiling, inventory tracking, and cross-matching integrated with IKnowU.

WebHistopath — Histopathology System

Backend: CakePHP, MySQL · Frontend: HTML, jQuery

SYSNET, IDEAWURX Inc.

Web Programmer *May 30, 2011 – April 16, 2012*

- Developed CMS platforms for the following projects: CallMyName, LottoCell, SNMPMonitoringSystem, MMDASystem.

Personal Projects

Autonomous Snake

Vanilla JavaScript (ES6+), HTML5 Canvas — frontend-only, no frameworks or libraries; all pathfinding and game logic implemented from scratch

- Implemented A*, BFS, and DFS pathfinding from scratch, driving a layered AI strategy that escalates from greedy hunting to survival fallbacks as the board fills, with a Hamiltonian cycle fallback for a guaranteed-completion mode.
- Diagnosed and fixed subtle emergent bugs invisible to unit-level testing, pushing consistent board-occupancy survival to 60–78% across five board sizes.
- Optimized core search performance 5–10x (BFS 25ms → 2.4ms, A* 30ms → 5ms at 10,000 nodes) by replacing string-keyed Sets/objects with integer-keyed typed arrays and pre-allocated structures.

Education

Bachelor of Science in Information Technology — Major in System Development

Central Luzon State University, Science City of Muñoz, Nueva Ecija — 2007–2011

- DOST-SEI Undergraduate Scholarship, Department of Science and Technology — Science Education Institute (2007–2011)
- Dean's Lister, College of Arts and Science, Central Luzon State University
